

FqSwap (FQS)

WHITEPAPER

INTRODUCTION

FQS is a hyper deflationary token created and thought by holders, it work as an independent liquidity generation protocol and Frictionless autonomous yield farming together with manual buyback features.

FQS Holders benefit through static reward and also Through the Buy-Back strategy built into the contract.All You need to do is hold FQS.

WHY FQS?

FQS , is a decentralized
Deflationary token

Our vision is to make the record by growing
Token price from 0.000000001\$ to 1\$

BUYBACK PROCESS:

FQS buyback function, also known as “the Plutus” is funded by a 5% strategic buyback fee. The Plutus is the Greek god of wealth, and acts as a safety net for all FQS holders.

The tokens collected from the fees are converted into BNB and securely locked and stored in the FQS buyback contract. These funds are known as the Plutus reserves.

These reserves then become independent of the price of FQS the contract is coded so that the BNB in the Plutus reserves cannot be withdrawn and can only be utilized for the purposes of buying back FQS tokens from the open market and burning them.

When the buyback function is turned on, the contract automatically

buys back tokens after every sell transaction.

Once the FQS tokens are bought back, the new BNB amount is immediately burned.

This creates a true burn and guarantees the price per token will increase every time the buyback is activated.
